

Atmospheric chemistry Acidification

Pontus Roldin Div. Nuclear Physics Department of Physics Lund University

Acidification

Sulphur- and nitrogen-containing compounds are oxidized in the atmosphere and are transformed from the gas phase to solid or liquid phase in aerosol particles or cloud drops.

Sulphur and nitrogen are then found in the form of sulphates and nitrates.

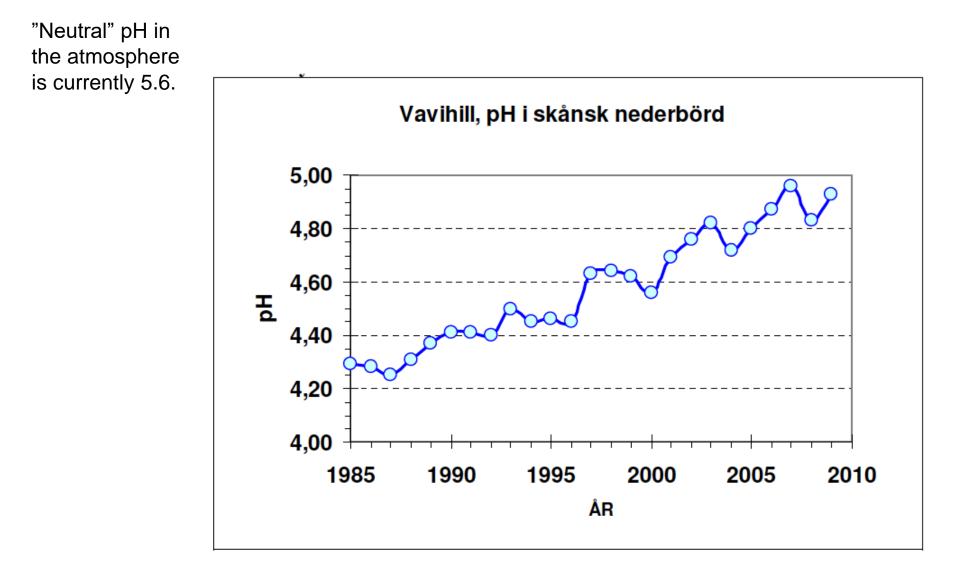

The acidic aerosol particles and cloud drops are deposited mainly as acid rain (wet deposition).

Levels of SO₂ in Sweden today are so low that they do not constitute a threat to human health.

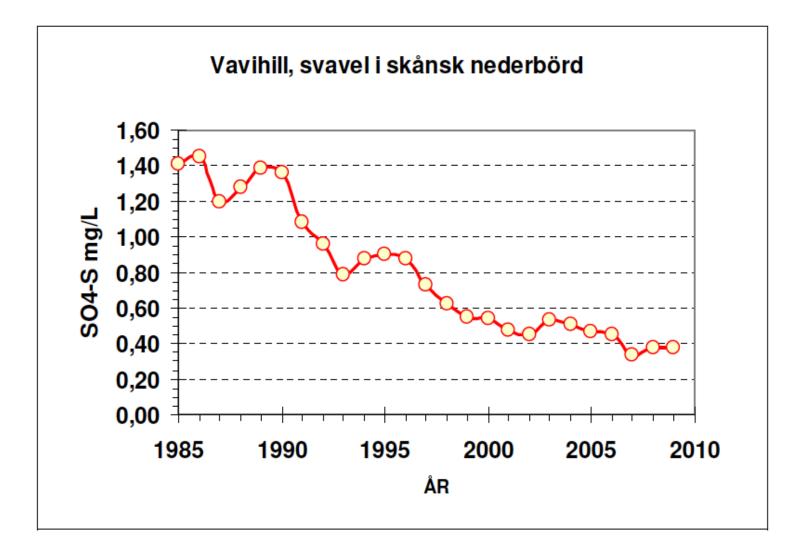

Concentrations of aerosol particles (with sulphates and nitrates as main constituents) can sometimes exceed current air quality limit values.

Acid deposition still exceeds what ecosystems can manage in the long-term (critical load).

Trend in wet deposition of acidifying compounds

Trend in wet deposition of acidifying compounds

Oxidation of sulphur in the gas phase

Sulphur dioxide SO_2 is emitted by combustion of fossil sulphurcontaining fuels, and is oxidized to sulphuric acid.

Gas-phase oxidation proceeds via the hydroxyl radical OH:

(10) $SO_2 + OH + M \rightarrow HSO_3 + M$

- (11) $HSO_3 + O_2 \rightarrow SO_3 + HO_2$ (fast)
- (12) $SO_3 + H_2O + M \rightarrow H_2SO_4 + M$ (fast)
- Net: $SO_2 + OH + O_2 + H_2O \rightarrow H_2SO_4 + HO_2$

H₂SO₄ is low volatile and water soluble and is removed from the gas phase by condensation onto aerosol particles and cloud droplets.

H₂SO₄ (sulphuric acid) is a strong acid and dissociates (splits into ions) in aqueous solution.

$$\begin{array}{ll} H_2 SO_4(aq) \leftrightarrow H^+ + HSO_4^{-1} & \text{as } S(VI) \\ HSO_4^{-}(aq) \leftrightarrow H^+ + SO_4^{-2} & \text{as } S(VI) \end{array}$$

Oxidation of sulphur in the aqueous phase

A considerable fraction of the oxidation of sulphur dioxide SO₂ takes place in the aqueous phase.

SO₂(g) is dissolved in an aqueous solution without being oxidized:

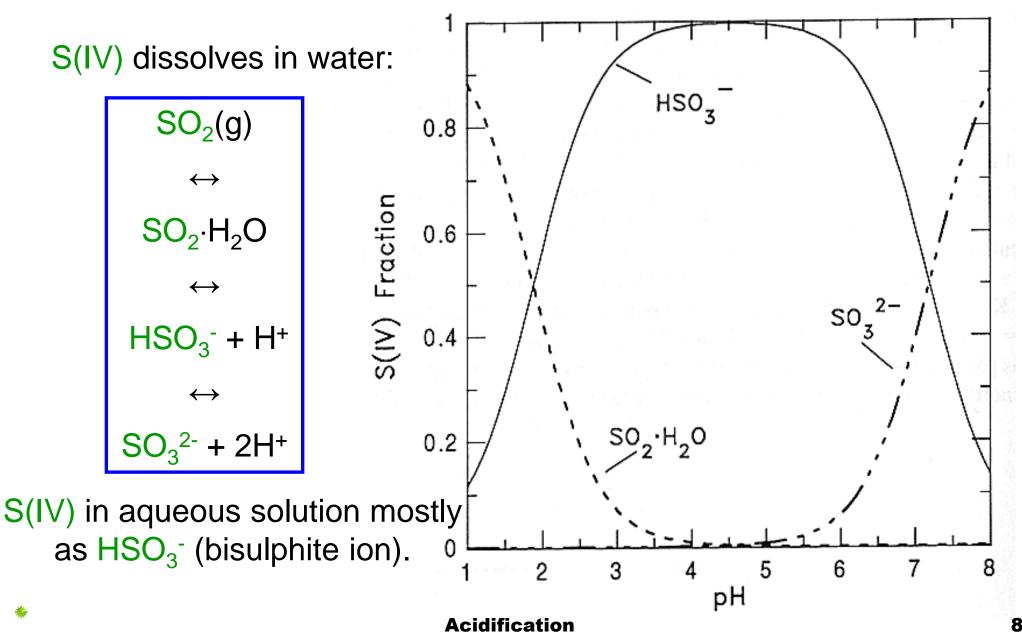

(13,14) $SO_2(g) \leftrightarrow SO_2 \cdot H_2O \leftrightarrow HSO_3^- + H^+$ $HSO_3^- \leftrightarrow SO_3^{2-} + H^+$

 $SO_2(g)$, HSO_3^- (bisulphite ion) and SO_3^{2-} (sulphite ion) are all S(IV).

As $SO_2(g)$ dissolves in water, H⁺ ions are released and acidify the solution, but the process is completely reversible and will not permanently acidify the aqueous solution (no oxidation).

SO₂ returns to the gas phase as the cloud droplet or the aerosol particle dries out.

Oxidation of sulphur in the aqueous phase

Oxidation of sulphur in the aqueous phase

S(IV) is **oxidized** in aqueous solution mainly by H_2O_2 . (H_2O_2 = hydrogen peroxide, very water-soluble)

- (15) $H_2O_2(g) \leftrightarrow H_2O_2(aq)$
- (16) $HSO_3^- + H_2O_2(aq) + H^+ \rightarrow 2H^+ + SO_4^{-2-} + H_2O_4^{-2-}$

The oxidation is acid-catalyzed (requires H^+) which makes this S(IV) oxidation pathway efficient also at low pH.

The reaction is very fast. Either all S(IV) or all H_2O_2 is titrated out in the aqueous solution.

Hydrogen peroxide H_2O_2 is formed via $HO_2 + HO_2 \rightarrow H_2O_2 + O_2$ in the gas phase (termination of HO_x radicals).

Nitrate N(V) formation

Nitric acid form in the gas-phase via oxidation of NO_2 with OH: $NO_2 + OH + M \rightarrow HNO_3 + M$

 $HNO_3(g)$ is dissolve in aquesous solutions:

 $HNO_3(q) \leftrightarrow HNO_3(aq)$ * $HNO_3(aq) \leftrightarrow NO_3^- + H^+$ **

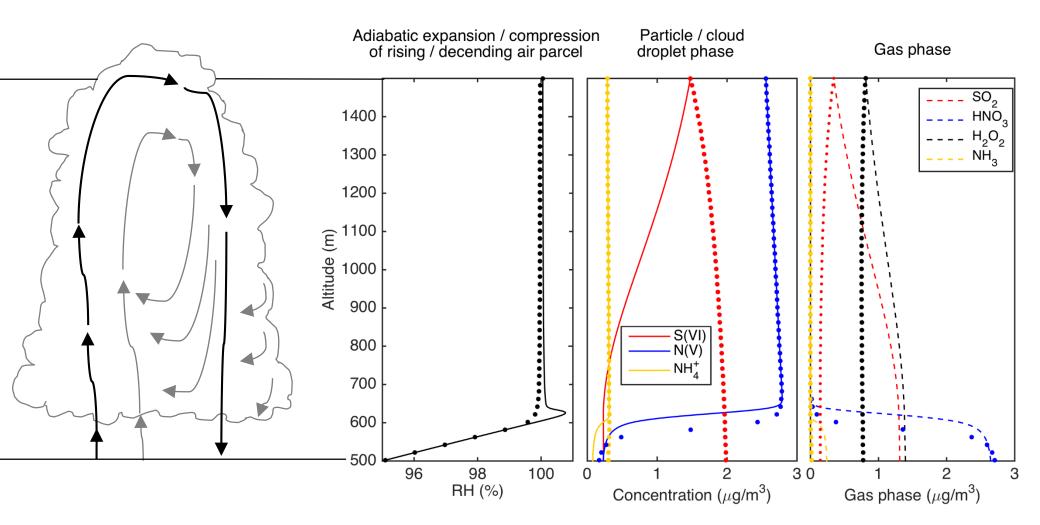

In cloud and rain droplets the dissociation of $HNO_3(aq)$ is complete and $HNO_3(g)$ is taken up efficiently.

In aerosol particle nitrate formation requires bases which can neutralize the concentrated acidic aqueous solution.

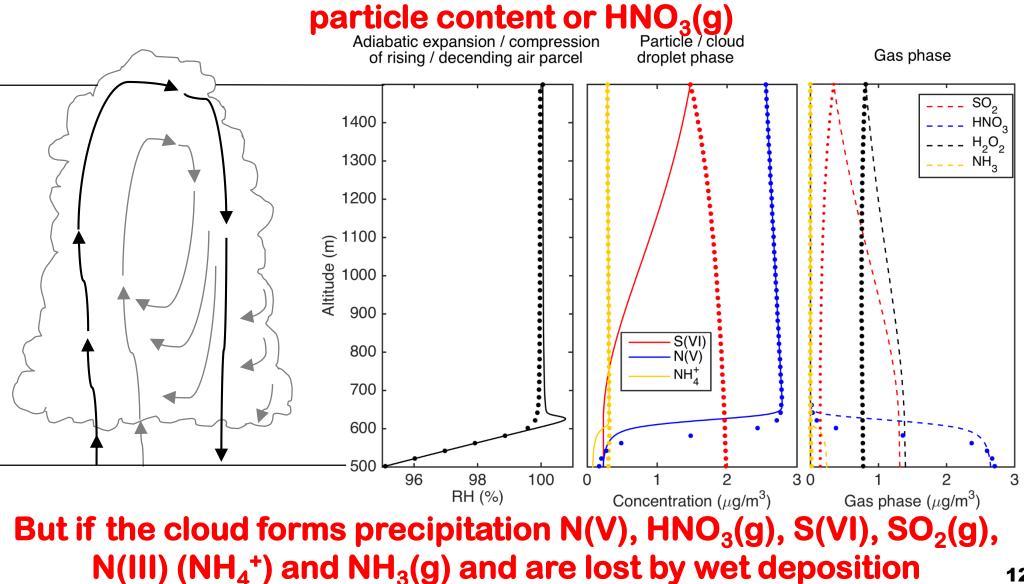

Ammonia (NH_3) scavenges H⁺ in aqueous solutions:

	$NH_3(g) \leftrightarrow NH_3(aq)$	***
(7)	$NH_3(aq) + H^+ \leftrightarrow NH_4^+$	*****
Net (*,**,***,****)	$NH_3(g) + HNO_3(g) \leftrightarrow NH_4^+ + NO_3^-$	

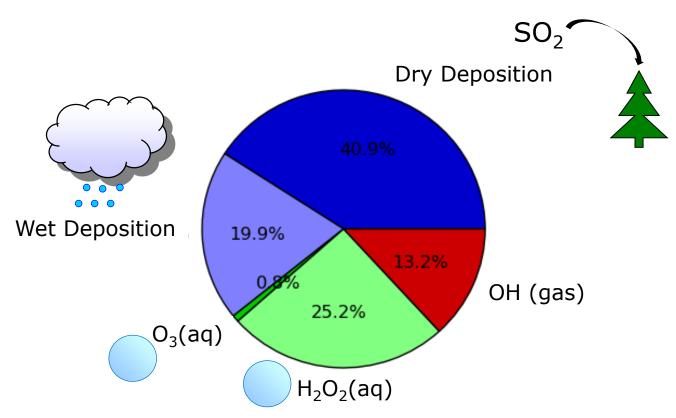

Oxidation of sulphur in the cloud aqueous phase Net effect: More S(VI) in the aerosol particles and less SO₂(g)

Dissolution of HNO₃ and formation of N(V) in the cloud aqueous phase Non-precipitating clouds have no net effect on the N(V) aerosol

Critical load – acidification, eutrofication

Definition (Nilsson and Grennfelt, 1988):

- "The threshold below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge is called the critical load."
- **Critical load** (*kritisk belastning*) for acidification, eutrofication
- Defines a total deposition which is sustainable in the long-term.
- Can be expressed in many ways.
- Ex: The 2-percentile for critical load is the deposition of acidifying (or eutrofying) compounds at which 98% of all ecosystems are protected in the long-term.

Exceedence of critical load

The critical load given as the 2- percentile (protects 98% of all ecosystems) (equivalents / ha / yr)
